In computing, aspect-oriented programming is a programming paradigm that aims to increase modularity by allowing the separation of cross-cutting concerns. It does so by adding additional behavior to existing code without modifying the code

itself, instead separately specifying which code is modified via a "pointcut" specification, such as "log all function calls when the function's name begins with 'set'". This allows behaviors that are not central to the business logic to be added to a program

~~Aspect-oriented programming~~ Wikipedia

The good news is that something like that does exist: aspect-oriented programming (AOP). It separates general code from aspects that cross the boundaries of an object or a layer. For example, the application log isn't tied to any application layer. It applies to the whole program and should be present everywhere.

~~Chapter 1. What Is Aspect-Oriented Programming?~~

Aspect-Oriented Programming. Aspect-Oriented Programming (AOP) is a programming paradigm which complements Object-Oriented Programming (OOP) by separating concerns of a software application to improve modularization. The separation of concerns (SoC) aims for making a software easier to maintain by grouping features and behavior into manageable parts which all have a specific purpose and business to take care of.

The motivation for aspect-oriented programming approaches stem

from the problems caused by code scattering and tangling. The

purpose of Aspect-Oriented Software Development is to

provide systematic means to modularize crosscutting concerns.

The implementation of a concern is scattered if its code is spread out

over multiple modules. The

concern affects the implementation of multiple modules.

modularity. But the key unit of modularity is aspect than class. AOP breaks the program logic into distinct parts (called concerns). It is used to increase modularity by cross-cutting concerns. A cross-cutting concern is a concern that can affect the whole application and should be centralized in one location in code as possible, such as transaction management, authentication, logging, security etc.

In this article, we will consider aspect-oriented patterns usage instead of commonly used OOP. Although AOP has existed for some time now, developers usually prefer OOP over AOP. While everything you do with AOP can be done with OOP as well, like procedural programming vs. OOP, AOP gives developers more choice in the paradigms they can use.

Developed in the 1990s, aspect-oriented programming (AOP) provides us attribute/ aspect components we can use in our classes at every level. These aspects exist as metadata for our classes which we can implement at run time to provide the required services on an as needed basis.
