This course-based text
revisits classic concepts
in nonlinear circuit
theory from a very
much introductory point
of view: the presentation

is completely self-contained and does not assume any prior knowledge of circuit theory. It is simply assumed that readers have taken a first-year undergraduate course in differential and integral calculus, along with an elementary physics course in classical mechanics and electrodynamics.

Further, it discusses topics not typically found in standard textbooks, such as nonlinear operational amplifier circuits, nonlinear chaotic circuits and memristor networks. Each chapter includes a set of illustrative and worked examples, along with end-of-chapter exercises and lab exercises using

Learning environment research has undergone considerable growth in the past thirty years and has now reached a stage of notable diversity and

internationalization.

Earlier studies often used questionnaires to assess learning

environments, but today

both qualitative and quantitative approaches are used. Many

contemporary studies

are a productive

combination of these

two approaches. This

volume brings together

prominent educators and

researchers from around the world to share their contemporary research on educational learning environments. The chapters provide information on recent trends and developments and effective applications of different methods to improve teaching and learning. The book will be a critical and

specialized source that describes recent advances in learning environment studies across all continents.

The contributors come from Australia, Belgium, Cyprus, Finland, India, Indonesia, Israel, Japan, The Netherlands, New Zealand, Singapore, Turkey, Taiwan, Thailand, and the USA.
