A non-Euclidean geometry is a rethinking and redescription of the properties of things like points, lines, and other shapes in a non-flat world. Spherical geometry—which is sort of plane geometry warped

What Are Euclidean and Non-Euclidean Geometry?

This is the most comprehensive exposition of non-euclidean geometries, with an emphasis on hyperbolic geometry. Greenberg is didactic, clear, precise and gives here an illuminating treatment of those subjects, preceded by a very good review of both the euclidean background as well as the historical aspects.

Euclidean and Non-Euclidean Geometry Euclidean Geometry
Euclidean Geometry is the study of geometry based on definitions, undefined terms (point, line and plane) and the assumptions of the mathematician Euclid (330 B.C.) Euclid ' s text Elements was the first systematic discussion of geometry. While many of Euclid ' s findings had been previously stated by earlier Greek mathematicians, Euclid

Euclidean and Non-Euclidean Geometry - A Plus Topper
As Euclidean geometry lies at the intersection of metric geometry and affine geometry, non-Euclidean geometry arises by either relaxing the metric requirement, or replacing the parallel postulate with an alternative. In the latter case one obtains hyperbolic geometry and elliptic geometry, the traditional non-Euclidean

Non-Euclidean geometry - Wikipedia

Non-Euclidean geometry is any type of geometry that is different from the “ flat ” (Euclidean) geometry you learned in school. It ’ s a set of geometries where the rules and axioms you are used to get broken: parallel lines are no longer parallel, circles don ’ t exist, and triangles are made from curved lines.

Carl Friedrich Gauss, probably the greatest mathematician in history, realized that alternative two-dimensional geometries are possible that do NOT satisfy Euclid ' s parallel postulate – he described them as non-Euclidean.

Elliptic geometry. Elliptic geometry is a non-Euclidean geometry with positive curvature which replaces the parallel postulate with the statement "through any point in the plane, there exist no lines parallel to a given line." Non-euclidean geometry: Topics & Problems

Euclidean geometry is an axiomatic system, in which all theorems ("true statements") are derived from a small number of simple axioms. Until the advent of non-Euclidean geometry, these axioms were considered to be obviously true in the physical world, so that all the theorems would be equally true. However, Euclid's reasoning from assumptions ...

In 2-dimensions: Euclidean geometry is flat (curvature = 0) and any triangle angle sum = 180 degrees. The non-Euclidean geometry of Lobachevsky is negatively curved, and any triangle angle sum < 180 degrees. The geometry of the sphere is positively curved, and any triangle angle sum > 180 degrees.

NON-EUCLIDEAN GEOMETRY

For more than 2,000 years, people had thought that Euclidean geometry was the only geometric system possible. Non-Euclidean geometry showed that there are other conceivable descriptions of space – a realization that transform mathematics into an altogether more abstract science.

In its rough outline, Euclidean geometry is the plane and solid geometry commonly taught in secondary schools. Indeed, until the second half of the 19th century, when non-Euclidean geometries attracted the attention of mathematicians, geometry meant Euclidean geometry. It is the most typical expression of general mathematical thinking.
