Paper chromatography - Online Biology Notes

Paper chromatography is an chromatography technique used to separate mixture of chemical substances into its individual compounds. Paper chromatography consists of two phases: one mobile phase and one contiguous stationery phase. Paper used in paper chromatography is made of cellulose.

paper chromatography a form of chromatography in which a sheet of blotting paper, usually filter paper, is substituted for the adsorption column. After separation of the components as a consequence of their differential migratory velocities, they are stained to make the chromatogram visible.

A paper chromatography variant, two-dimensional chromatography involves using two solvents and rotating the paper 90° in between. This is useful for separating complex mixtures of compounds having similar polarity, for example, amino acids. The setup has three ...

In the paper chromatography, component separates in two ways: In paper adsorption chromatography, stationary phase and mobile phase molecules act based on the degree of interaction. Higher affinity molecules are adsorbed for a long time where movement of speed is decreased. However, low affinity molecules move faster thus, molecules are separated.
